OVERVIEW

We are the only academic pediatric surgery center in Rhineland-Palatinate and committed to research in a wide spectrum of pediatric surgical disease. In the last year, we built up a dedicated pediatric surgical laboratory. Our research team comprises a PhD in biology and a dedicated research fellow, along with a number of graduate students.

Clinically, we are part of several research consortia on congenital malformations. We also perform research on telemedicine, care of refugee children, infertility after childhood operations, and short bowel syndrome.

Our lab focuses on Multiphoton Microscopy of Hirschsprung disease and pediatric solid tumors, as well as esophageal lengthening for congenital esophageal atresia.

HIGHLIGHTS

MULTIPHOTON MICROSCOPY (MPM)

Multiphoton Microscopy has been proposed as a real-time microscopic imaging modality that may be a useful adjunct for the surgeon in the operating room. We previously proved the ability to accurately determine the distribution of ganglion cells in mice with Hirschsprung’s disease, and are currently working on translation of the method to human application. In pediatric surgical oncology, three-dimensional real-time imaging of tissue may provide immediate feedback to the surgeon on resection margins. Recently, we presented our results on characterizing pediatric solid tumors using MPM. The next step is to document sensitivity, specificity, and interobserver congruence compared to conventional histology.

SINGLE-INCISION PEDIATRIC ENDOSURGERY (SIPES)

SIPES is accomplished through only a single small incision in the navel, minimizing the visible scar and potentially reducing incisional pain associated with the multiple points of entry used during traditional laparoscopic surgery. Within our department, a variety of novel laparoscopic procedures were first described early childhood, and are now routinely and safely performed with this method. The aim of new research projects is to establish this method for minimal invasive tumor surgery in comparison to standard laparoscopy, and to expand indications in combination with other innovative techniques.

TELEMEDICINE

Telemedicine is the use of telecommunication and information technologies in order to provide clinical health care at a distance. Telemedicine can be broken into three main categories: store-and-forward, remote monitoring and (real-time) interactive services. Real-time interactive service using the Adobe Connect Software is evaluated for routine outpatient care with great success. Trauma projects and telemedical cooperation with outpatient physicians are goals of further research work. We currently completed a randomized controlled study comparing telemedical with conventional follow-up of our patients.

ESOPHAGEAL GROWTH INDUCTION

Management of congenital long-gap esophageal atresia is one of the greatest challenges in pediatric surgery. While several esophageal lengthening procedures have been described and are currently used in our department clinically, the mechanisms behind esophageal growth induction through traction are yet poorly understood. We are evaluating the physical, histologic and molecular effects of esophageal traction in the porcine and human model.
FUTURE DIRECTIONS

Our future goal is to establish the interoperative use of MPM to map the aganglionic segment in children with Hirschsprung disease in real-time, and to determine resection margins of pediatric solid tumors during surgery. Also, we would like to expand our telemedicine initiative to include other centers and indications, studying both potential economic and ecologic effects, as well as the benefits on patient care and interdisciplinary collaboration. Concerning esophageal lengthening, we have submitted an animal research protocol to study esophageal compliance and how anastomosis under tension impacts on leak and stenosis.

In terms of clinical research, we are currently reviewing the largest patient series of thoracoscopic sympathectomy for the treatment of hyperhidrosis and its impact on patient quality of life. A further project is testing the availability of a YouTube video as a supplemental source of information for the parents in the consent process when children are scheduled for inguinal hernia repair. Finally, we are evaluating the effect of sleep deprivation, interruptions, and alcohol intoxication on the workflow and performance of robotic surgery in a simulator model.
