

# THE FUNCTIONAL STATUS AND ITS PREDICTION ONE YEAR AFTER HIP OR KNEE REPLACEMENT

Ulrich Betz, Laura Langanki\*, Jürgen Konradi, Ruben Westphal, Philipp Drees, Sebastian Kuhn

ISPRM World Congress 2023, Cartagena

\* The data analysis is part of the dissertation of Laura Langanki

# THE FUNCTIONAL STATUS AND ITS PREDICTION ONE YEAR AFTER HIP OR KNEE REPLACEMENT

Ulrich Betz, Laura Langanki\*, Jürgen Konradi, Ruben Westphal, Philipp Drees, Sebastian Kuhn

- no conflicts of interest -

# PROMISE Trial

- **“Process optimization by interdisciplinary and cross-sectoral care using the example of patients with hip and knee prostheses”**
- Recommendations of the Enhanced Recovery After Surgery (ERAS) Society with some extensions
- 3 German hospitals offering different levels of care
- 5 cooperating rehabilitation centers
- **subanalysis: n=507 participants:** TKA (n=268), TKA both (n=40), THA (n=199)

| Variables / Questionnaire                     |  | Construct / Expression  |  |

## Timed Up and Go – Test (TUG)

Wolf, 2022

- Functional Mobility
- Very good Intrarater-Reliability (ICC = 0.92) and Interrater-Reliability (ICC = 0.91/0.87)
- Independence / Secure Walking TUG ≤ **12 sec** (10 sec)

## Timed Up and Go – Test (TUG)

- Functional Mobility
- Very good Intrarater-Reliability (ICC = 0.92) and Interrater-Reliability (ICC = 0.91/0.87)
- Independence / Secure Walking TUG ≤ **12 sec** (10 sec)

# PROMISE Trial - cohort

|  |                     | N   | Minimum | Maximum | Mean value   | Std. deviation |

## Mobilization on day of surgery

- 417 (82%) of patients could be mobilized on the day of surgery

# Reasons for „Mobilization on day of surgery“ not possible

| Reasons  | Frequencies (n=90 / 100%) |
|--|---------------------------|
| Organizational reasons                             | 38 / 42%                  |
| Late-effects of anesthesia (sensomotoric deficits) | 21 / 23%                  |
| Circulatory problems                               | 11 / 12%                  |
| Other (pain, complications)                        | 8 / 9%                    |
| Nausea / vomiting                                  | 7 / 8%                    |
| Not specified                                      | 5 / 6%                    |

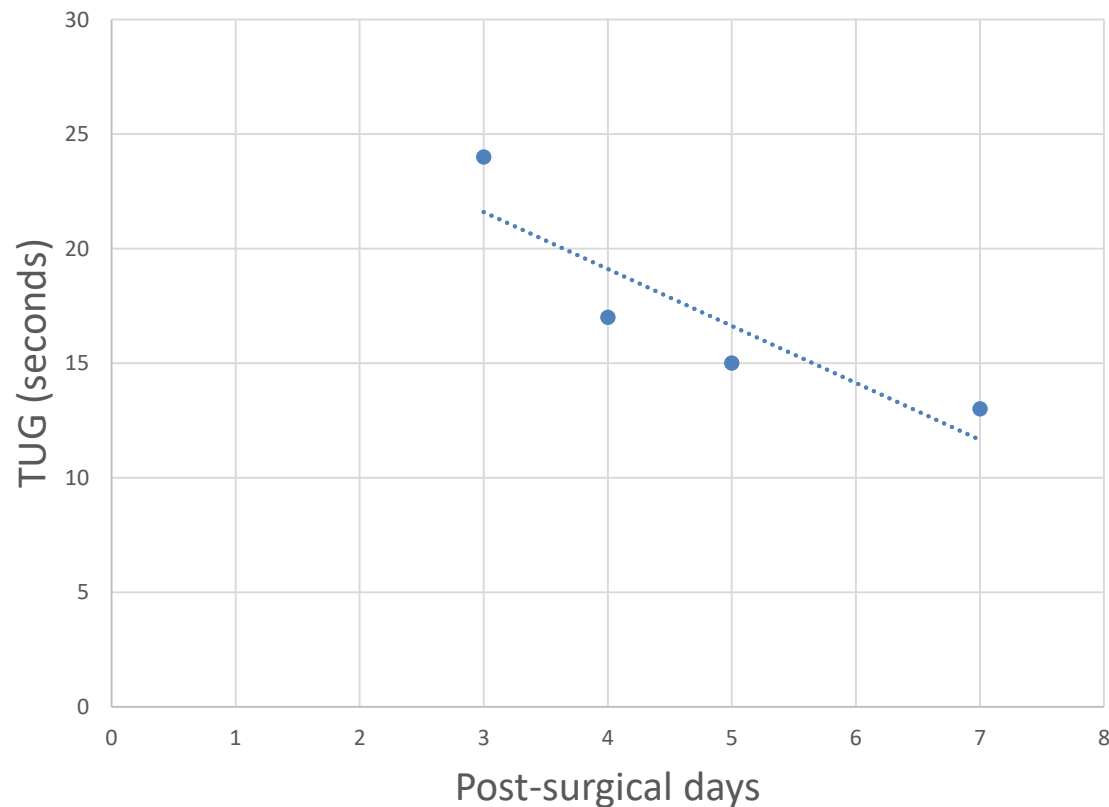

# TUG in the course of the postsurgical days

PSD = post-surgical day

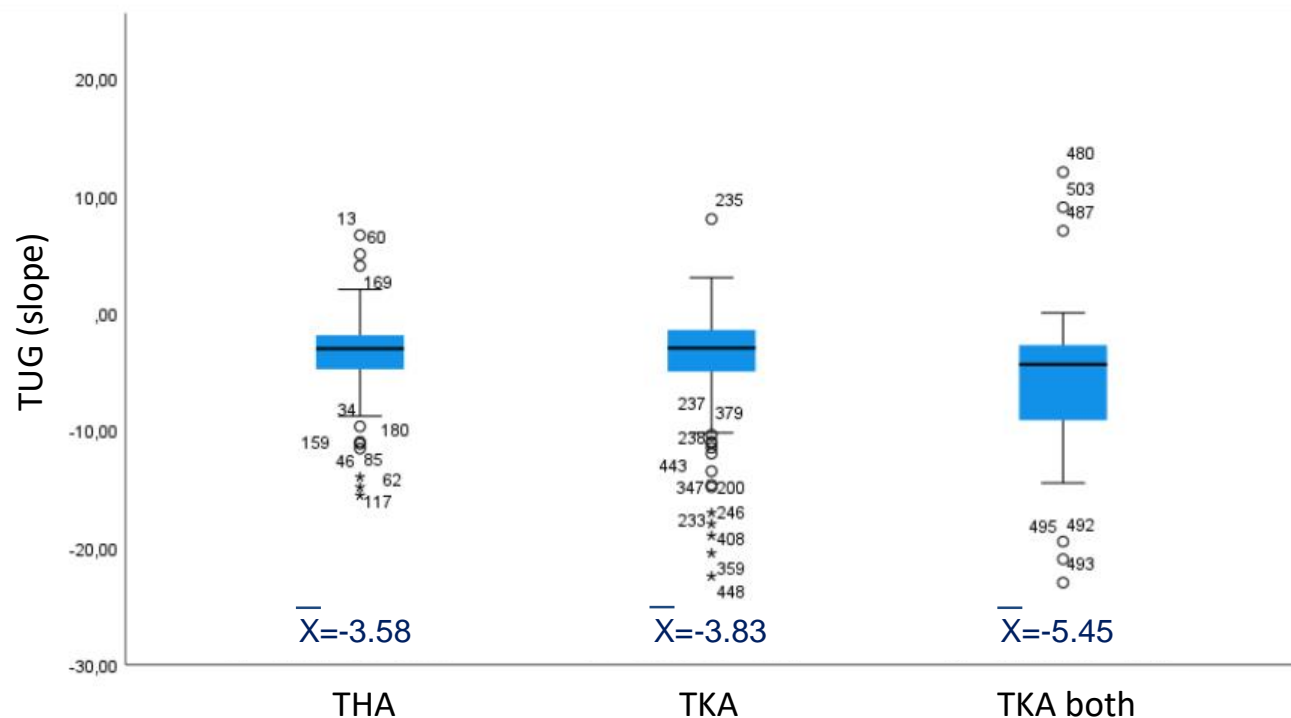

# TUG in the course of the postsurgical days

- The slope of the regression line: Mean value  $\bar{X} = -3.85$  (SD=3.9)

## TUG in the course of the postsurgical days

- The slope of the regression line:  
Mean values THA  $\bar{X}=-3.58$ , TKA  $\bar{X}=-3.85$ ; TKA both  $\bar{X}=-5.45$

# TUG at different time-points

- All joint groups show significant mobility improvements after one year

## TUG at 1 year FU

- 1 year TUG: outliers (from 18 sec.) and 2 extreme values (from 25 sec.)  
All patients had at least 4-9 comorbidities and/or complications.

# TUG prediction models

- TUG prediction 1 year by **multiple linear regression analysis**
- **stepwise variable selection** excluded the following variables: BMI, gender, ASA (physical health status), SSS (ROM/strength) OSSS (social support), LOT-R (optimism/pessimism), aid use, exertional pain and the remaining comorbidities

# TUG prediction models

- **Model A** statistically significant  $p < .001$
- **Predictors: Pre-TUG, age, comorbidity: rheumatism**
- Coefficient of determination:  $R^2=.54$  (corrected  $R^2=.53$ ): 53% of the variance of the 1 year TUG value can be predicted by the predictors

| Model A    | Non-standardized coefficients<br>Coefficient of regression B | Standardized coefficients<br>Beta | Significance |
|------------|--|-----------------------------------|--------------|
| (Constant) | 2.092  |                                   |              |
| Pre TUG    | 0.305  | 0.59                              | 0.00         |
| Rheumatism | 3.509  | 0.27                              | 0.00         |
| Age        | 0.055  | 0.18                              | 0.02         |

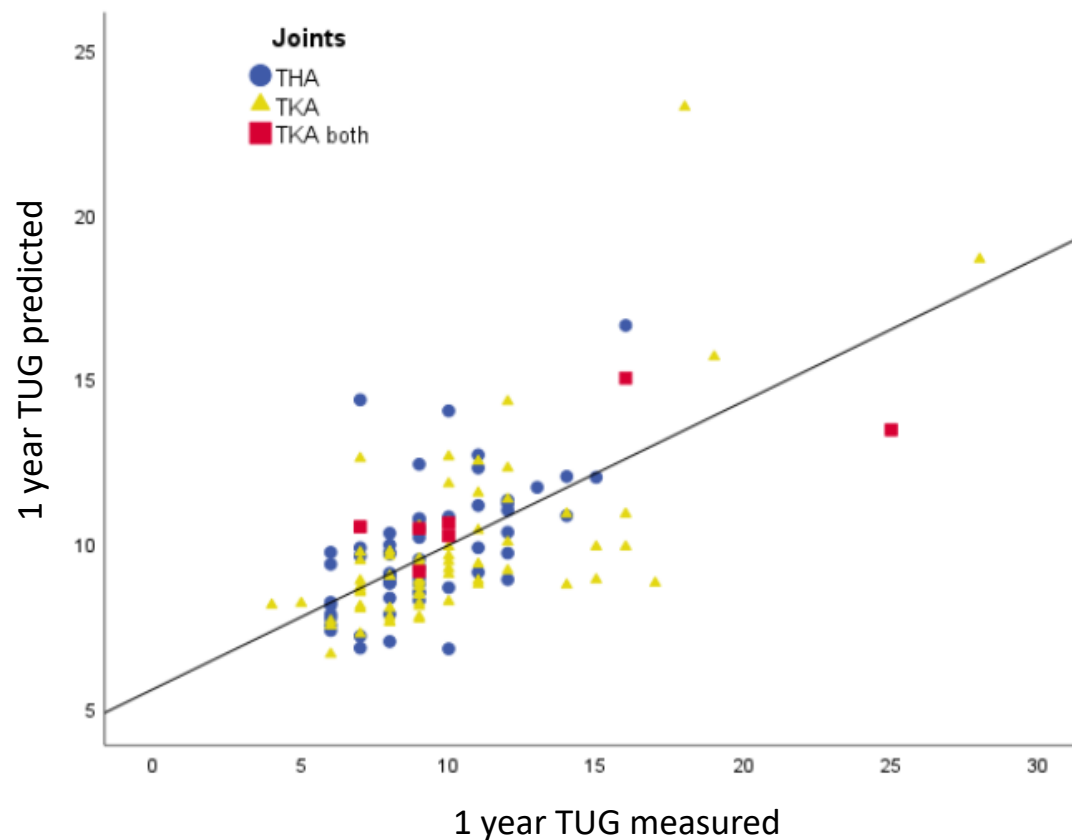

## TUG prediction models

- **Predictors: Pre-TUG, age, comorbidity: rheumatism**
- **For example:**  
Pre-TUG = 35 seconds; age = 70 years ; rheumatism = no
- **Prediction for TUG 1 year by Model A =**  
$$2.092 + [0.305 \times (35)] + [0.055 \times (70)] + [3.509 \times (0)] = 16.61 \text{ sec}$$
  
(measured TUG 1 year = 16 seconds)

# TUG prediction models - Model A

- Model A: Pre-TUG, age, rheumatism

# TUG prediction models - Model A

- Model A: Pre-TUG, age, rheumatism

# TUG prediction models

- **Model B** without comorbidities (n=117) statistically significant  $p < .001$
- **Predictors: Pre-TUG, age, PHQ-4 (anxiety/depression)**
- Coefficient of determination:  $R^2=.48$  (corrected  $R^2=.47$ ): 47% of the variance of the TUG 1 year value can be predicted by the predictors

| Model B    | Non-standardized coefficients<br>Coefficient of regression B | Standardized coefficients<br>Beta | Significance |
|------------|--|-----------------------------------|--------------|
| (Constant) | 0.84   |                                   |              |
| Pre TUG    | 0.31   | 0.59                              | 0.00         |
| Age        | 0.06   | 0.21                              | 0.01         |
| PHQ4       | 0.24   | 0.18                              | 0.01         |

## Take Home

- in an ERAS setting, most patients can be mobilized on the day of surgery
- the most important reason for non-mobilization are organizational ones
- functional mobility improves rapidly and continuously up to 4 days after surgery
- after one year, the functional mobility for TKA, TKA both and THA is significantly improved compared to the preoperative status and is on average above the cut off for unsafe walking
- functional mobility for TKA, TKA both and THA can be predicted on the basis of preoperative parameters with a medium power
